	b)	A session is a way to store information (in variables) to be used across multiple pages. Session variables solve this problem by storing user information to be used across multiple pages (e.g. username, favorite color, etc). By default, session variables last until the user closes the browser. Session variables hold information about one single user, and are available to all pages in one application. <u>Start a PHP Session</u> A session is started with the session_start() function. Session variables are set with the PHP global variable: \$_SESSION. <u>Modify a PHP Session Variable</u> To change a session variable, just overwrite it: <u>Destroy a PHP Session</u> To remove all global session variables and destroy the session, use session_unset() and session_destroy()	6
