

Block diagram of instrumentation system

primary sensing element

- Known as sensor
- Basically transducers are used as a 1st sensing element-
- Here the physically quantity are sensed & then converted into an analogous signal.

Variable conversion element-

- It converts the output of variable sensing element- into suitable form without changing information.
- Basically these are 2nd sensing element-

Variable Manipulation Element

- The output of transducers may be electrical signal i.e., voltage, current or other electrical parameters.

Here manipulation means change in numerical value of signal. This element is used to convert the signal into suitable range.

Data Transmission element-

The data is transferred from one place to another place through channel which is known as data transmission element. It can be wired or wireless media.

Data Presentation or controlling Element-

Finally the output is recorded or given to the controller to perform action.

It performs different functions like indicating, recording or controlling.
